Slot : C

Project Title: FoodRescue AI – Smart Food Redistribution Using Markov Decision process and Bellman Equations

Module Photographs:

Project Description:

I contributed significantly to the design and development of the FoodRescue AI – Smart Food Redistribution System by focusing on Module 3: NGO Demand Prediction using K-Nearest Neighbors (KNN). My contribution included designing the workflow for analyzing NGO requirements and predicting the food demand based on historical data and relevant factors such as food type, quantity required, location, previous demand patterns, and the number of beneficiaries.

In addition, I was actively involved in implementing the KNN-based demand prediction process, including data preprocessing, feature selection, similarity calculation, and identification of the nearest matching data points. The predicted demand information was then smoothly passed to the subsequent Q-Learning-based Smart NGO Selection module, enabling the system to select the most suitable NGO for efficient and timely food redistribution.
